MUHAMMED AZHAR

Principal Engineer, Backend & Agentic AI

muhammedazhar.salim@gmail.com • github.com/macs666 • Ernakulam, Kerala | Open to Remote

SUMMARY

Backend engineer with 10+ years across mobile, backend, and platform engineering, now extending into applied agentic AI. Founding backend engineer on IMA360, a B2B pricing and revenue management SaaS platform serving Fortune 500 clients including McKesson — owned architecture, security, and cloud infrastructure end-to-end, then scaled the engineering team from 6 to ~30 developers. Deep hands-on expertise in Node.js, Go, REST/GraphQL API design, microservices, PostgreSQL, and Kubernetes-based deployments across AWS and GCP. Currently building hands-on agentic AI skills — RAG pipelines and Google ADK — to extend that platform expertise into production-grade automation. A fast learner who figures things out by building, whether that meant teaching myself Go in a month or navigating an enterprise product as a solo backend engineer.

EXPERIENCE

Chief AI Researcher & Engineer
Aug 2026 – Present

Recapp (Cascade Labs)

- Lead AI for Recapp, a practice management platform for mental health organisations in India: scheduling, billing and an AI scribe that drafts session notes for the therapist to review and sign
- Build AI agents for the team's everyday work with RAG pipelines and Google ADK, on production backend foundations

Senior Backend Engineer (Golang)
March 2024 – 2026

IMA360 *Texas, US (Remote)*

IMA360 is a B2B pricing and revenue management SaaS platform. Clients include McKesson, a Fortune 10 healthcare distribution company.

- Joined IMA360 directly as a senior hire after building the product's backend from the ground up as the founding engineer at Exalture
- Owned end-to-end architecture and backend development for the Customer Rebate module — a high-volume financial calculation engine with APIs processing millions of records, leveraging Go's concurrency primitives (goroutines, worker pools, channel pipelines) to sustain throughput and low latency for multi-tiered rebate agreements and accrual logic across enterprise clients
- Acted as module lead for multiple product areas, coordinating frontend engineers, QA, and business analysts to ship each module on schedule
- Maintained and extended the security architecture originally established as founding engineer — covering API authentication and authorisation, role-based access control, and secure handling of sensitive financial records
- Primary technical knowledge transfer resource for incoming engineers; created architecture documentation and onboarding runbooks
- Contributed to scaling the engineering team from 6 to ~30 developers, setting code and architecture standards that kept the platform coherent and maintainable as headcount grew

Software Engineer (iOS & Go Backend)
May 2019 – Feb 2024

Exalture Software Solutions *Kochi, Kerala*

Service company delivering outsourced mobile and backend projects for international clients, including Qatar-based enterprises.

iOS Development (2019 – 2021)

- Built and shipped the iOS app for Qatar Museum — a public-facing cultural institution application
- Developed the iOS app for Abraj (AQG), a Qatari real estate group, covering property listings, enquiries, and client-facing features

IMA360 Project — Go Backend (2021 – 2024)

- Assigned as the sole backend engineer on the IMA360 client project; self-taught Go in one month before starting the engagement
- Designed the full backend architecture from scratch — API layer, database schema, financial calculation engine, concurrency model using Go goroutines and worker pools, and security framework including RBAC and API access controls; all established as the sole engineer before the team scaled
- Established the Go codebase patterns, API conventions, and module structure that the expanding team built upon; set up the initial cloud infrastructure on AWS using Docker and Kubernetes before handing off to a dedicated DevOps function as the company scaled
- Delivered production-ready backend as the team grew from a 2-person engagement to a multi-team product organization

Qwikcilver (Pine Labs) — Node.js Backend

Qwikcilver is a leading prepaid and gift card fintech platform (acquired by Pine Labs) serving enterprise clients including Tata Group, Myntra, and Vistara. Based in bangalore

- Contributed as a Node.js backend engineer on a concurrent Exalture client engagement within Qwikcilver's fintech platform

Founder & Technical Officer
Jun 2017 – May 2019

Eygert Tech Pvt. Ltd. *Kochi, Kerala*

- Led a cross-functional team of 6 engineers delivering products across mobile (iOS/Android), web, and embedded hardware

EDUCATION

B.Tech Computer Science
KMEA Engineering College
Left to pursue industry opportunities
2013 – 2016

12th Computer science CBSE
Al Ameen Public School
2013

10th Std SSLC
Rajagiri Higher Secondary School
2011

KEY ACHIEVEMENTS

Founding Backend Engineer
Founding backend engineer on IMA360 — designed the architecture, concurrency model, security framework, and initial cloud infrastructure (AWS, Docker, Kubernetes) that scaled to serve Fortune 500 clients including McKesson.

Million-Record Scale
Built high-concurrency financial calculation APIs processing millions of records using Go goroutines and worker pools — sustaining throughput and low latency for enterprise pricing systems.

Fast-Track Language Adoption
Self-taught Go in one month and proceeded to own the entire backend of an enterprise SaaS product from its inception.

Extending Into Agentic AI
Applying the same fast-learner approach to agentic AI — currently building hands-on skills in RAG pipelines and Google ADK to extend production backend systems into automated agent workflows.

LANGUAGES & FRAMEWORKS

Go (Golang) | Node.js | Gin | Express.js | Swift | JavaScript

INFRASTRUCTURE & TOOLS

PostgreSQL | MongoDB | Redis | WebSocket | Docker | GraphQL | AWS Lambda | RabbitMQ | GCP | Kubernetes | Go ADK | RAG

DOMAINS

Pricing & Revenue | Fintech | Sys Architecture | IoT / Embedded

- Managed end-to-end delivery of IoT and mobile projects; responsible for technical direction, code reviews, and client communication

Backend & iOS Developer Mar 2016 – May 2017
Technorip *Kochi, Kerala*

- Built backend systems using Express.js and Loopback for client projects
- Worked with embedded systems including PIC microcontrollers, Arduino, Raspberry Pi, and computer vision using OpenCV

Mobile App Developer Intern Sep 2015 – Nov 2015
Chillr (acquired by Truecaller) *Kochi, Kerala*

- Contributed to Android app development and introduced iOS development capability within the intern team
